SUMMARY

Product and platform engineer who builds customer-facing software and the systems behind it. Shipped enterprise onboarding, billing, integrations, deployment, and cloud infrastructure while helping scale an AI-agent platform from fewer than five users to hundreds.

EDUCATION

University of California, Santa Cruz — M.S. Natural Language Processing (2025), B.S. Computer Science (2023)

SKILLS

- **Languages:** Python, TypeScript, JavaScript, SQL, Bash, Dart
- **Backend / Data:** FastAPI, REST APIs, webhooks, OAuth, authentication, PostgreSQL, Firebase, multi-tenancy, billing systems
- **Frontend / Infra:** React, Next.js, Flutter, Docker, GCP, GitHub Actions, CI/CD, release tooling with rollback, automated testing, production debugging
- **Applied AI:** Agent workflows, RAG, tool calling, evaluation, observability, LangGraph

EXPERIENCE

Founding Engineer <i>Levangie Laboratories — Two-engineer AI-agent platform team</i>	Feb 2026 – Sep 2026 <i>Remote</i>
– Customer Acquisition: Turned an open-source web chat widget into an embeddable production AI assistant that unblocked an enterprise pilot and purchase and was later deployed for additional customers. – Enterprise Onboarding: Built the multi-tenant workspace and billing system that enabled the first organizational customer, including centralized access, shared balances and memory, and payment, refund, and transfer workflows. – Cloud Runtime: Built and load-tested a replacement GCP/Docker runtime for on-demand isolated agent containers, eliminating capacity waits and crashes as individual and enterprise usage grew. – Integrations Platform: Built multi-account OAuth, webhooks, scheduling, and in-product setup for session-aware agent workflows, replacing a customer’s file-based workaround and adding persistent memory and reconciliation. – Release Engineering: Built four GitHub Actions workflows and a one-command release tool with rollback, replacing manual deployments with tested promotion across development, staging, and production. – Incident Response: Resolved a production cascade that left users unable to load agents by fixing blocking authentication work and deferring heavy startup imports; cut API startup memory by 75%, from 594 MB to 147 MB, and helped add circuit breakers, rate limits, and monitoring that prevented recurrence.	
AI Systems Consultant <i>Gray Whale — Four-engineer enterprise AI platform team</i>	Jun 2025 – Jan 2026 <i>Remote</i>
– Developer Platform: Built a Python/LangGraph planner-executor with dynamic agent discovery and a wrapper adopted by all three co-engineers for 5–10 specialized agents. – Developer Enablement: Built a tool that converted participants’ datasets into the platform’s required JSON format, enabling hands-on projects at Developer Camp, a 48-hour AI hackathon. – Evaluation Strategy: Established that a 700-document benchmark could not meaningfully separate semantic retrieval systems without a much larger corpus, informing a shift to tool routing with a controlled function catalog.	
ML/AI Engineer (Part-Time) <i>Onda Sports — Surf-forecasting app; sole engineer for AI assistant</i>	May 2025 – Sep 2025 <i>Remote</i>
– Production AI: Took sole ownership of the assistant inside an externally developed iOS/Android codebase, owning its prompts, retrieval behavior, evaluation, and production integration while working directly with founders. – Observability: Instrumented retrieved data, model responses, latency, and token cost so failures and quality changes were traceable across releases. – Product Quality: Built a roughly 70-prompt regression set that exposed incorrect skill-level interpretation; redesigned and shipped retrieval and prompting behavior, verifying response and document-retrieval accuracy.	
Full-Stack Developer and Product Consultant <i>Boardal — Surfboard marketplace; first hire and only non-founder engineer</i>	Apr 2024 – Jun 2025 <i>San Diego, CA</i>
– User Engagement: Increased daily active usage and brought users back to a marketplace with 20,000+ registered users by building saved-search alerts and push-notification delivery. – Mobile Ownership: Shipped production messaging and listing workflows by owning delivery from scoping and Flutter UI through Firebase data flows, notifications, and iOS releases alongside a cofounder.
